Effects of nonsteroidal anti-inflammatory drugs on expression of adhesion molecules in rat peritoneal cells. Nonsteroidal anti-inflammatory drugs (NSAIDs) are widely used in the treatment of various diseases and conditions, including rheumatoid arthritis and peptic ulcers. In the present study, we examined the effects of three representative NSAIDs: diclofenac (DIF), indomethacin (IDO) and ketoprofen (KETO) on expression of intercellular adhesion molecule (ICAM)-1, endothelial leukocyte adhesion molecule (ELAM)-1, lymphocyte function-associated antigen (LFA)-1, and their receptors in rat peritoneal cells (RPCs). DIF and IDO inhibited the expression of ICAM-1, ELAM-1, LFA-1, and their receptors in RPCs in a concentration-dependent manner. On the other hand, KETO did not affect the expression of adhesion molecules. These results suggest that the anti-inflammatory actions of NSAIDs may be related to the inhibition of the expression of adhesion molecules.

The Cationic Polymer Surfactant/Resin Covalently Bonded to Polymer Fibers for Gene Transfection and Drug Delivery. A cationic polymer (polyethylenimine, PEI) covalently bonded to fibers for gene transfection and drug delivery is presented. Coating the core-sheath fibers with PEI creates positively charged surfaces. Electrostatic interactions with
